ISDN/Source-Connect

Source Connect is an exciting and emerging alternative to ISDN. Connections are handled over the Internet, rather than via ISDN lines.

Source-Connect eliminates the need for expensive ISDN lines, additional hardware, subscription fees and minute-by-minute line charges, enabling high-quality connections between studios, voiceover talent, and musicians anywhere in the world. This translates to increased workflow, smoother running sessions and cost savings passed on to our clients.

Unlike ISDN, which requires complex set-up, Source-Connect appears right in the Pro Tools session as a plug-in. A selection from the user-defined contact list initiates a connection. Source-Connect enables audio connections between Pro Tools systems anywhere in the world, allowing direct-to-timeline recording with real-time, fully duplex, broadcast-quality audio using only Cable, or DSL Internet connections. The system also allows for remote voiceovers (or music) to be recorded in sync to picture.

Source-Connect operates seamlessly with ISDN codecs when used in conjunction with bridging services. Simply contact your local bridging service or remote location studio prior to your session. (See links below)

With Pro Tools firmly established as the de-facto standard for audio post, and with most facilities now working on this platform, we believe the time is right for Source-Connect.

We believe this to be the future for the transmission of CD quality real-time audio over a digital network. Oasis Digital will fully support and embrace Source-Connect and be part of it's ever growing worldwide user base.
